Getting Tested is the Best thing "YOU" can do for your HEALTH!

National HIV Testing Day (NHTD) is an annual campaign coordinated by the [National Association of People with AIDS](#) to encourage people of all ages to **"Take the Test, Take Control."**

THANK YOU!! EVENT PARTNERS & SPONSORS

GET TESTED! GET THE FACTS!

HIV among Youth

- Youth aged 13 to 24 accounted for an estimated 26% of all new HIV infections in the United States in 2010.
- Most new HIV infections among youth occur among gay and bisexual males; there was a 22% increase in estimated new infections in this group from 2008 to 2010.
- Almost 60% of youth with HIV in the United States do not know they are infected.

HIV among Older Americans

- Americans aged 50 and older have many of the same HIV risk factors as younger Americans.
- Persons aged 55 and older accounted for 19% (217,300) of the estimated 1.1 million people living with HIV infection in the United States in 2010.

Older Americans are more likely than younger Americans to be diagnosed with HIV infection later in the course of their disease.

HIV among Women

- One in four people living with HIV infection in the United States are women.
 - Most new HIV infections in women are from heterosexual contact (84%).
- Only about half of women who are diagnosed with HIV are in care, and even fewer (4 in 10) have the virus under control.

HIV among Men

- Men accounted for 76% of all adults and adolescents living with HIV infection at the end of 2010 in the United States.
 - Men who have sex with men account for most new and existing HIV infections among men.
- By race/ethnicity, black men have the highest rates of new HIV infections among all men.
- In 2010, an estimated 1.1 million people aged 13 years or older were living with HIV infection in the United States. Most (76%) of those living with HIV were male, and 69% of males were gay, bisexual, and other men who have sex with men (MSM).
